

COMPETITIVE POSITIONING BRIEF

Why 1325.AI Outclasses Every Business Directory on the Internet

A landscape analysis of 35+ horizontal, vertical, B2B, community, identity, and marketplace directories — and why none of them compete on the axis that defines the next decade.

EXECUTIVE SUMMARY

A category of one — by design.

Prepared for investors, partners, and acquirers evaluating the competitive landscape of business directories and agentic commerce infrastructure.

1325.AI is the operating system for community-anchored businesses in the agentic economy. While the global directory landscape has consolidated around **35+ players** across six structural categories — horizontal giants, B2B/enterprise data providers, local/community feeds, niche identity directories, review-led verticals, and marketplaces — every one of them ultimately produces a **list**. None of them **operate** the business that appears on the list.

That distinction is the entire thesis. Directories compete on indexed breadth, review volume, and ad inventory — moats that are **20+ years deep** and largely commoditized. 1325.AI competes on a different axis: the **Agentic Commerce Protocol**—a patent-protected orchestration layer (USPTO 63/969,202, 27 claims) that runs marketing, sales, finance, HR, customer success, and operations through **Kayla** and 42 specialized sub-agents on behalf of every business on the network.

The historical precedent is unambiguous. **Stripe** did not replace banks; banks plug into Stripe. **Shopify** did not replace storefronts; storefronts plug into Shopify. **AWS** did not replace data centers; data centers plug into AWS. In the same pattern, directories — from Google Business Profile to EatOkra — will plug into 1325.AI when their listed businesses need to *actually function* with AI employees. We are not a directory. **We are the layer the directories will eventually depend on.**

Category of one	Across 35+ directories, four of 1325.AI's capabilities are unmatched by any competitor: AI employee orchestration, patent-protected agentic rails, true wealth-circulation ledger, and 17-line revenue diversification.
Defensible IP	27 patent claims filed (USPTO Provisional 63/969,202) covering agent orchestration, geospatial fraud detection, B2B matching algorithms, and voice AI integration.
Unit economics directories cannot match	Each business on 1325.AI replaces ~4 full-time roles and captures \$12,100+/month in operating savings — outcomes no directory delivers because no directory operates the business.
Protocol position	1325.AI lives at Level 3 of agentic AI maturity (orchestrated AI organizations), where only ~0.05% of the AI market operates. The remaining 99.95% builds assistants and operators that will eventually call agentic protocols like ours.

01 · THE THESIS

We do not compete on the biggest list.

We compete on the operating system for the business itself. On that axis, no other company is on the field.

The directory industry has spent two decades optimizing for the same three variables: **indexed breadth** (how many businesses are listed), **review density** (how many stars and comments per listing), and **monetization surface** (how much advertising the page will absorb). Google, Yelp, Bing Places, and Apple Maps have effectively won that contest. Capterra, G2, and Clutch have done the same in B2B; EatOkra, OBWS, and ByBlack in identity directories. The leaderboard is set.

1325.AI declines the contest. We are not trying to out-index Google or out-review Yelp. We are building the layer those directories will plug into when their listings need to *function*—to sell, to invoice, to schedule, to recover lost revenue, to onboard new staff, to handle a customer complaint at 2 a.m. **That layer is an operating system, not a list.**

Google lists businesses.
Yelp reviews them. EatOkra curates them.

1325.AI runs them.

We are not a directory. We are the operating system
the directories will eventually plug into.

02 · THE LANDSCAPE

The global directory market, in six categories.

Every meaningful business directory on the internet — grouped by structural model and primary monetization.

Category	Representative players	What they actually do	Monetization
Horizontal Giants	Yelp · Google Business Profile · Bing Places · Apple Maps · TripAdvisor · Yellow Pages · Foursquare	200M+ listings combined. Ad-driven. Zero operational layer.	\$210B+ digital ads
B2B & Enterprise	Clutch · G2 · Capterra · ThomasNet · Crunchbase · ZoomInfo · Apollo	Analyst quadrants, intent data, and outbound lead lists. Does not touch the business.	\$8B+ sales intel
Local & Community	Nextdoor · Alignable · Patch	Neighborhood feeds and peer networks. No commerce rails, no AI orchestration.	Ad-supported
Niche Identity Directories	EatOkra · OBWS · ByBlack · We Buy Black · Hello Alice · IFundWomen · GLAAD · AAPI directories · Latino Business Action Network	Hand-curated cultural lists. Honorable mission. Typically 1–2 revenue streams.	Grants + sponsorship
Review-Led Verticals	Houzz · Avvo · Healthgrades · Zocdoc · The Knot	Deep vertical scheduling and reviews. Single industry. No cross-category AI layer.	Booking fees + leads
Marketplaces as Directories	Etsy · Amazon Handmade · Faire · Thumbtack · Angi	Transactional with take-rate. The business still operates itself end-to-end.	Transaction take-rate

Read across the table. Six structurally distinct categories, 35+ companies, and a single shared characteristic: every business model on the page produces a *list*. None of them runs the business that appears on the list.

Sources: company 10-Ks, S-1s, Crunchbase, Pitchbook, eMarketer 2025, IDC 2025. Listing counts as of Q1 2026.

03 · CAPABILITY MATRIX

Where the categories converge — and where 1325.AI diverges.

Nine operational capabilities benchmarked against each directory category. Green = delivered. Amber = partial. Red = absent.

Capability	Horizontal Giants	B2B / Enterprise	Niche / Identity	Vertical Review	Marketplaces	1325.AI
Indexed business listings	●	●	●	●	●	●
Reviews & ratings corpus	●	●	■	●	●	●
Operates the business (AI employee + sub-agents)	■	■	■	■	■	● Kayla + 42 sub-agents
Patent-protected agentic orchestration	■	■	■	■	■	● 27 claims · 63/969,202
Wealth-circulation ledger	■	■	■	■	■	● Community-traced
Diversified revenue (≥10 lines)	■ ads	■ leads	■ 1–2	■ booking	■ take-rate	● 17 lines
Agentic Commerce Protocol (rails for AI agents)	■	■	■	■	■	●
Owns transaction ledger + supply-chain graph	■	■	■	■	■	●
Voice-native customer ops (real-time AI)	■	■	■	■	■	● "Talk to Kayla"

● Delivered · ■ Partial · ■ Absent

Five capabilities — operating the business, patent-protected orchestration, wealth-circulation ledger, the Agentic Commerce Protocol, and voice-native customer operations — are held by 1325.AI **alone**. That is not a feature gap. That is a different category of company.

04 · MARKET CONTEXT

The numbers behind the opportunity.

Why the directory category is structurally exhausted — and why the agentic layer is wide open.

05 · WHAT THEY DO · WHAT WE DO

Every competitor in a single verb.

If you can describe a directory in a single verb, it is not an operating system.

<i>Google</i>	lists businesses.	A \$1.6T market displayed as ten blue links.
<i>Yelp</i>	reviews them.	Star ratings monetized through paid placement.
<i>Clutch / G2 / Capterra</i>	ranks them.	Analyst quadrants and pay-to-play tiers.
<i>Crunchbase / ZoomInfo / Apollo</i>	profiles them.	Subscriber data sold to sales teams.
<i>EatOkra / OBWS / ByBlack</i>	curates them.	Hand-built cultural lists. Honorable. Static.
<i>Houzz / Zocdoc / Healthgrades</i>	books them.	Vertical scheduling. One industry at a time.
<i>Nextdoor / Alignable / Patch</i>	talks about them.	Community feeds. No commerce layer.
<i>Etsy / Faire / Thumbtack / Angi</i>	transacts with them.	Marketplace take-rate. Business still self-operates.

And then —

1325.AI runs them.

Marketing · Sales · Finance · HR · Customer Success · Operations
orchestrated by **Kayla + 42 sub-agents** on patent-protected rails.

06 · THE PROTOCOL PLAY

Why every directory eventually plugs into us.

The pattern is not new. Infrastructure layers commoditize the layers below them.

Historical precedent

Stripe	did not replace banks.	Banks plug into Stripe.
Shopify	did not replace storefronts.	Storefronts plug into Shopify.
AWS	did not replace data centers.	Data centers plug into AWS.
Twilio	did not replace telcos.	Telcos route through Twilio.
1325.AI	does not replace directories.	Directories will plug into 1325.AI.

Why this position is defensible

- **27 patent claims** filed under USPTO Provisional 63/969,202 covering agent orchestration, geospatial fraud detection, B2B matching algorithms, and real-time voice AI integration.
- **17 active revenue lines** across directory, AI employee licensing, loyalty rewards, B2B marketplace, hospitality (Mansa Stays), rideshare (Noire), corporate sponsorships, the Gemini Enterprise add-on, media kit, education hub, sales-agent program, QR scanner, marketing materials, mentorship, technical partner program, vacation rentals, and white-label licensing.
- **~4 roles covered** per business and **\$12,100+/month** in operating savings — unit economics no directory can match because no directory operates the business.
- **True wealth-circulation ledger** — every transaction is traced through the community, not merely counted. No competitor on the landscape page holds this primitive.
- **Level 3 AI organizations.** 99.95% of the AI market lives at Level 1 (assistants) or Level 2 (operators). 1325.AI lives at Level 3, where orchestrated agent teams run entire businesses.
- **Voice-native customer operations.** Real-time AI conversation ("Talk to Kayla") is in production today; no directory in any category has a comparable surface.

What we are not claiming. 1325.AI does not have Google's search index, Yelp's two-decade review corpus, or Crunchbase's enterprise sales pipeline. We are not trying to. Those moats are 20+ years deep, ad-funded, and effectively closed. Our moat has a different shape: **we own the layer that makes every listing useful in an agentic economy.** When that economy arrives at scale — and the Martell framework, McKinsey's 2025 agentic-AI report, and Gartner's 2026 AI organization outlook all argue it is arriving — the lists become commodity inputs to the operating system.

07 · APPENDIX

Methodology, sources, and definitions.

How the landscape was constructed and how the capability matrix was scored.

Methodology

Directory inventory compiled June 2026 from public web indexes, Crunchbase, Pitchbook, Apple App Store and Google Play category leaders, and Producthunt's all-time directory tag. Capability scoring conducted against published product documentation, public earnings disclosures, and direct platform inspection. A capability is marked **delivered** only if the function is live in the platform's default product surface; **partial** if available in an enterprise tier or beta; **absent** if not offered.

Definitions

Agentic Commerce Protocol. The orchestration, ledger, and supply-chain graph layer on which autonomous AI agents discover, transact, and circulate value across an underserved market.

AI organization (Level 3). A coordinated team of specialized AI agents that operates an end-to-end business function without human-in-the-loop for routine workflows.

Wealth-circulation ledger. A transaction record in which value is traced through community recipients, not solely counted as gross merchandise volume.

Kayla. 1325.AI's primary AI employee, orchestrating 42 specialized sub-agents across marketing, sales, finance, HR, customer success, and operations.
